

CS2043 Team 8 Design Project: Deliverable 0

Project Proposal

<TBD>

Contributors: Gian Karl Cera, Hazem Alfeky, Dexter Lyons

Overview: We're going to be making a computer application that facilitates employee reimbursement. The job of the application is to replace the old manual way of getting reimbursement by paper forms. Our aim is to make this process faster more organized and less time consuming, we're going to achieve that by making a dashboard which employees can make requests and another dashboard for managers / people doing reimbursements. They can organize these requests with several filters we're planning on implementing. Requests can now be done online more easily and can quickly be organized by being logged and employees will be able to see when their requests are accepted or rejected.

Primary functions: The application will first have a prompt asking the user whether they are employees or management, and then it will lead into a log in page. After logging in, it will direct the user if they are an employee to a dashboard and in which they can add reimbursement requests. Each request contains information about employee id, trip id, date, location, costs, type of expense, reason for expense, and manager name and id. For managers, it will allow them to see requests based on filters like employee id, trip id, etc. They will be able to either reject or accept the requests. There's going to be a cap on each trip id with a certain amount of budget, and if there's a request that exceeds the total sum already reimbursed, it will be rejected.

Employees requests will have a status, either rejected, accepted or pending. Employees can also cancel requests. We will also implement a way for employees to filter the status. There's also going to be a log history that an employee and manager will have to track their request and accepted / rejected requests respectively.

Secondary functions: After a request it should show recommendations for approved suppliers or there could be a tab containing said information. There should also be notifications sent to employees after either a rejection or an acceptance of the request. Employees should also be able to edit their profiles like changing emails, names, etc. An additional reset password would be useful too for forgotten passwords. We could also add an FAQ tab on how the application works. There could also be a dark mode or a light mode for those with sensitive eyes. A visual indicator for how much money left in the budget would also be useful, it could be a bar with green bar with a red bar advancing. A small popup that confirms for important decisions could also help those who are having second thoughts, one for example could be before accepting an employee request.
